#### The G(n,p) model

#### Properties of almost all graphs

Phase transition

### 球旁 G(n,p) Model (不是一多长息)

- G(n, p) Model [Erdös and Rényi1960]: |V| = n is the number of vertices, and for and different  $u, v \in V$ ,  $\Pr(\{u, v\} \in E) = p$ .
- Example. If  $p = \frac{a}{n}$ .

Then 
$$E(\deg(v)) = \frac{d}{n}(n-1) \approx d$$

$$n \approx n - 1$$
  $\mathcal{F} \in \mathcal{F} \cap \mathcal{F} \cap \mathcal{F}$ 

#### Example: G(n, 1/2)

$$K = \deg(v)$$

$$\Pr(K = k) = {n-1 \choose k} \left(\frac{1}{2}\right)^k \left(\frac{1}{2}\right)^{n-k}$$

$$\approx {n \choose k} \left(\frac{1}{2}\right)^k \left(\frac{1}{2}\right)^{n-k} = \frac{1}{2^n} {n \choose k}$$

$$E(K) = n/2$$
$$Var(K) = n/4$$

Independence!

**Binomial Distribution** 

#### Recall: Central Limit Theorem

#### Normal distribution (Gauss Distribution):

 $X \sim N(\mu, \sigma^2)$ , with density function:

$$f(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}, \quad -\infty < x < +\infty$$

As long as  $\{X_i\}$  is independent identically distributed with  $E(X_i) = \mu$ ,  $D(X_i) = \sigma^2$ , then  $\sum_{i=1}^{n} X_i$  can be approximated by normal distribution  $(n\mu, n\sigma^2)$  when n is large enough.

• 
$$G(n, 1/2)$$
  
 $\mu = n\mu' = E(K) = \frac{n}{2},$   
 $\sigma^2 = n(\sigma')^2 = Var(K) = n/4$ 

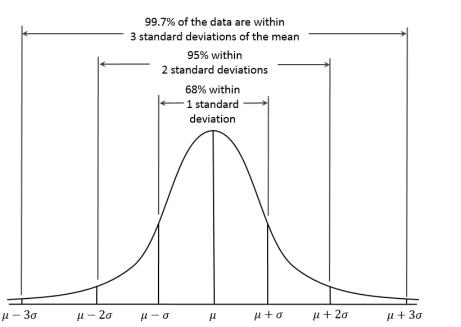

(CLT) Near the mean, the binomial distribution is well approximated by the normal distribution.

$$\frac{1}{\sigma\sqrt{2\pi}}e^{-\frac{(k-n\mu)^2}{2\sigma^2}} = \frac{1}{\sqrt{\pi n/2}}e^{-\frac{(k-n/2)^2}{n/2}}$$

It works well when  $k = \Theta(n)$ .

• G(n, 1/2): for any  $\epsilon > 0$ , the degree of each vertex almost surely is within  $(1 \pm \epsilon) \frac{n}{2}$ .

**Proof.** As we can approximate the distribution by

$$\frac{1}{\sqrt{\pi n/2}} e^{-\frac{(k-n/2)^2}{n/2}}$$

$$\mu = \frac{n}{2}, \sigma = \frac{\sqrt{n}}{2}$$

$$\mu \pm c\sigma = \frac{n}{2} \pm c\frac{\sqrt{n}}{2} \approx (1 \pm \epsilon)\frac{n}{2}$$

• G(n,p): for any  $\epsilon>0$ , if p is  $\Omega\left(\frac{\ln n}{n\epsilon^2}\right)$ , then the degree of each vertex almost surely is within  $(1\pm\epsilon)np$ .

Proof. Omitted

G(n, p) Model: independent set and clique

**Lemma.** For all integers n, k with  $n \ge k \ge 2$ ; the probability that  $G \in G(n, p)$  has a set of k independent vertices is at most

$$\Pr(\alpha(G) \ge k) \le \binom{n}{k} (1 - p)^{\binom{k}{2}}$$

the probability that  $G \in G(n, p)$  has a set of k clique is at most

$$\Pr(\omega(G) \ge k) \le \binom{n}{k} (p)^{\binom{k}{2}}$$

Lemma. The expected number of k —cycles in  $G \in G(n,p)$  is  $E(x) = \frac{(n)_k}{2k}p^k$ .

**Proof.** The expectation of certain n vertices  $v_0, v_1, \dots, v_{k-1}, v_0$  form a length k cycle is:  $p^k$ 

The possible ways to choose k vertices to form a cycle C is  $\frac{(n)_k}{2k}$ .

The expectation of the number of all cycles:

$$E(X) = \sum_{k} (X_k) = \frac{(n)_k}{2k} p^k$$

#### The G(n, p) model

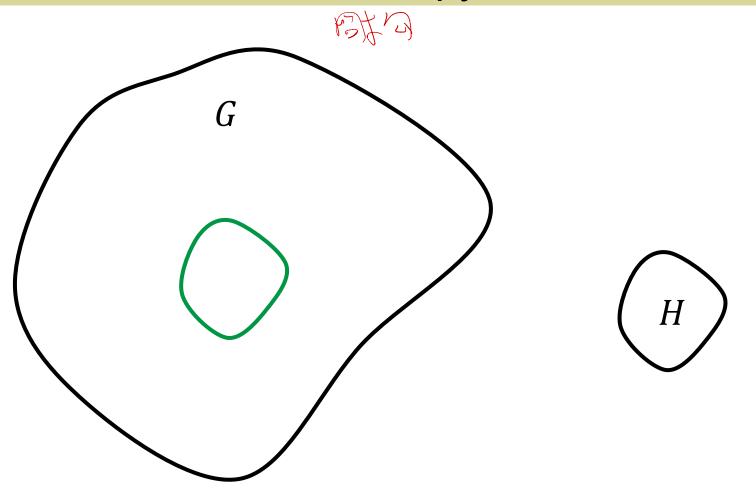

#### Properties of almost all graphs

#### Phase transition

#### Properties of almost all graphs

- For a graph property P, when  $n \to \infty$ , If the *limit* of the probability of  $G \in G(n,p)$  having the property tends to
  - 1: we say than the property holds for almost all (almost every / almost surely)  $G \in G(n, p)$ .
  - **0**: we say than the property holds for almost no *G* ∈ G(n, p).

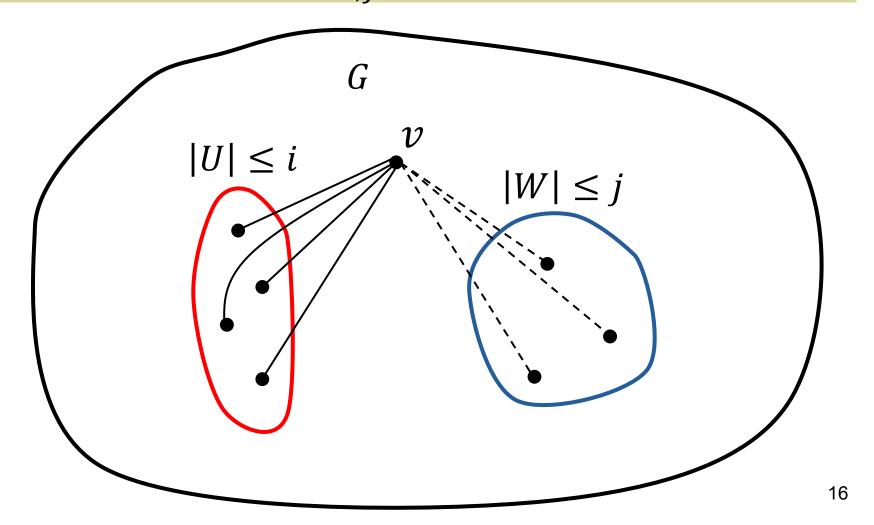

**Proposition.** For every constant  $p \in (0,1)$  and every graph H, almost every  $G \in G(n,p)$  contains an induced copy of H.

**Proposition.** For every constant  $p \in (0,1)$  and every graph H, almost every  $G \in G(n,p)$  contains an induced copy of H.

**Proof.** 
$$V(G) = \{v_0, v_1, ..., v_{n-1}\}, k = |H|$$
  
Fix some  $U \in \binom{V(G)}{k}$ , then  $\Pr(U \cong H) = r > 0$   
 $r$  depends on  $p, k$  not on  $n$ .  
There are  $\lfloor n/k \rfloor$  disjoint such  $U$ .  
The probability that none of the  $G[U]$  is isomorphic to  $H$  is:  $= (1-r)^{\lfloor n/k \rfloor}$   $\downarrow r$   
 $\Pr[\neg (H \subseteq G \text{ induced})]: \leq (1-r)^{\lfloor n/k \rfloor}$   $\downarrow r \to \infty$ 

**Proposition.** For every constant  $p \in (0,1)$  and  $i, j \in N$ , almost every graph  $G \in G(n,p)$  has the property  $P_{i,j}$ .

**Proposition.** For every constant  $p \in (0,1)$  and  $i, j \in N$ , almost every graph  $G \in G(n, p)$  has the property  $P_{i,j}$ .

**Proof.** Fix U, W and  $v \in G - (U \cup W), q = 1 - p$ ,

The probability that  $P_{i,j}$  holds for v:  $p^{|U|}q^{|W|} \ge p^i q^j$ 

The probability there's no such v for chosen U, W:

$$= (1 - p^{|U|}q^{|W|})^{n-|U|-|W|} \le (1 - p^i q^j)^{n-i-j}$$

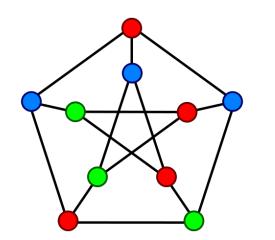

The upper bound for the number of different choice of  $U, W: n^{i+j}$ 

The probability there exists some U, W without suitable v:

$$\leq n^{i+j} \left(1 - p^i q^j\right)^{n-i-j} \xrightarrow{n \to \infty} 0$$

#### Coloring

- Vertex coloring: to G = (V, E), a vertex coloring is a map  $c: V \to S$  such that  $c(v) \neq c(w)$  whenever v and w are adjacent.
- Chromatic number  $\chi(G)$ : the smallest size of S.

$$\chi(G)=3$$

#### Coloring

- Vertex coloring: to G = (V, E), a vertex coloring is a map  $c: V \to S$  such that  $c(v) \neq c(w)$  whenever v and w are adjacent.
- Chromatic number  $\chi(G)$ : the smallest size of S.
- Some famous results:
  - Whether  $\chi(G) = k$  is NP-complete.
  - Every Planar graph is 4-colourable.
  - [Grtözsch 1959]Every Planar graph not containing a triangle is 3-colourable.

**Proposition.** For every constant  $p \in (0,1)$  and every  $\epsilon > 0$ , almost every graph  $G \in \mathbf{G}(n,p)$  has chromatic number  $\chi(G) > \frac{\log(1/q)}{2+\epsilon} \cdot \frac{n}{\log n}$ 

**Proof.** The size of the maximum independent set in  $G: \alpha(G)$ 

$$\Pr(\alpha(G) \ge k) \le \binom{n}{k} q^{\binom{k}{2}} \le n^k q^{\binom{k}{2}}$$

$$= q^{k \frac{\log n}{\log q} + \frac{1}{2}k(k-1)} = q^{\frac{k}{2}\left(-\frac{2\log n}{\log(1/q)} + k - 1\right)}$$
(\*)

Take  $k = (2 + \epsilon) \frac{\log n}{\log(1/q)}$  then (\*) tends to  $\infty$  with n.

$$\therefore \Pr(\alpha(G) \ge k) \xrightarrow{n \to \infty} 0 \Rightarrow \frac{\text{No } k \text{ vertices can have the same color.}}{\text{same color.}}$$

$$\therefore \chi(G) > \frac{n}{k} = \frac{\log(1/q)}{2 + \epsilon} \cdot \frac{n}{\log n}$$

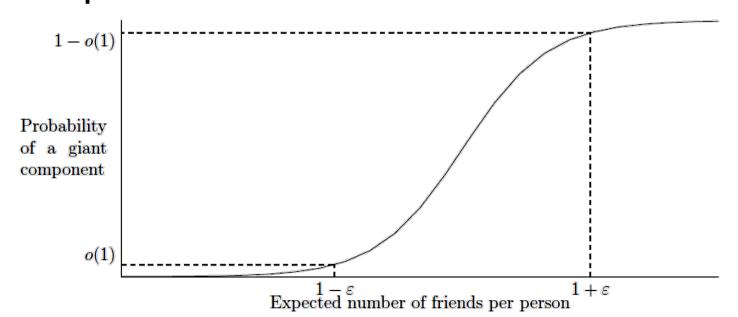

#### The G(n, p) model

#### Properties of almost all graphs

#### Phase transition

#### Phase transition

The interesting thing about the G(n, p) model is that even though edges are chosen independently, certain global properties of the graph emerge from the independent choice.

#### Phase transition

**Definition.** If there exists a function p(n) such that

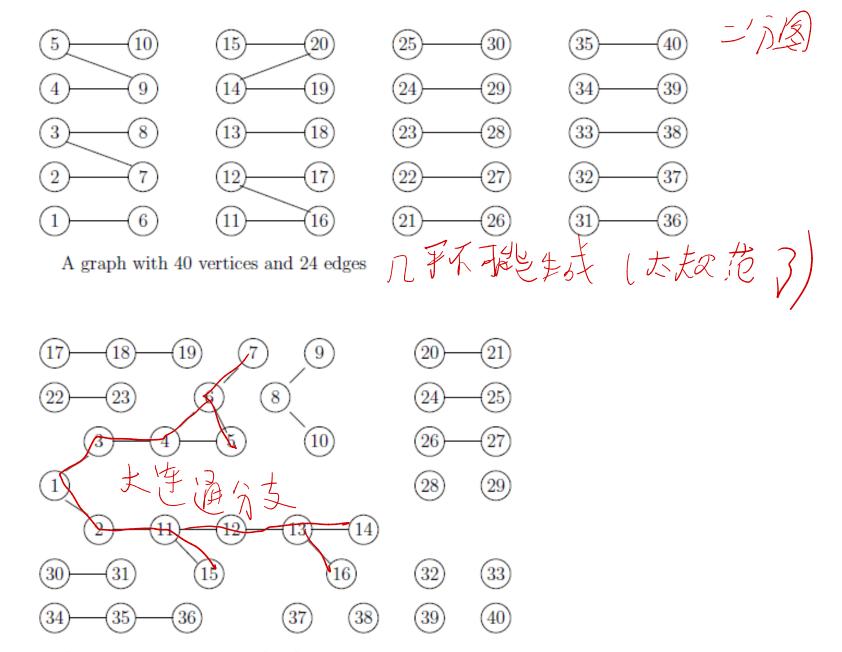

- when  $\lim_{n\to\infty}\left(\frac{p_1(n)}{p(n)}\right)=0$ ,  $G(n,p_1(n))$  almost surely does not have the property.
- when  $\lim_{n\to\infty}\left(\frac{p_2(n)}{p(n)}\right)=\infty$ ,  $G(n,p_2(n))$  almost surely has the property.

Then we say phase transition occurs and p(n) is the threshold.

#### Phase transition

Probability	Transition
$p = o(\frac{1}{n})$	Forest of trees, no component
	of size greater than $O(\log n)$
$p = \frac{d}{n}, d < 1$	All components of size $O(\log n)$
$p = \frac{d}{n}, d = 1$ $p = \frac{d}{n}, d > 1$	Components of size $O(n^{\frac{2}{3}})$ ( $2$
$p = \frac{d}{n}, d > 1$	Giant component plus $O(\log n)$ components
$p = \sqrt{\frac{2\ln n}{n}}$	Diameter two つい カルカレ
$p = \frac{1}{2} \frac{\ln n}{n}$	Giant component plus isolated vertices
$p = \frac{\ln n}{n}$	Disappearance of isolated vertices
	Appearance of Hamilton circuit
	Diameter $O(\log n)$
$p = \frac{1}{2}$	Clique of size $(2 - \epsilon) \ln n$

A randomly generated G(n, p) graph with 40 vertices and 24 edges

25

不为生的非决策

#### First moment method

**Markov's Inequality:** Let x be a random variable that assumes only nonnegative values. Then for all a > 0

$$\Pr(x \ge a) \le \frac{E[x]}{a}$$

First moment method: for non-negative,

integer valued variable x X用专计数 a 发生的次数

$$Pr(x > 0) = Pr(x \ge 1) \le E(x)$$

$$Pr(x = 0) = 1 - Pr(x > 0) \ge 1 - E(x)$$

不发生的并成实

26

First moment method: for non-negative, integer valued variable x

$$Pr(x > 0) = Pr(x \ge 1) \le E(x)$$
  
 $\therefore Pr(x = 0) = 1 - Pr(x > 0) \ge 1 - E(x)$ 

- If the expectation goes to 0: the property almost surely does not happen.
- If the expectation does not goes to 0:

文文 e.g. Expectation = 
$$\frac{1}{n} \times n^2 + \frac{n-1}{n} \times 0 = n$$
 其序文文 [2]

i.e., a vanishingly small fraction of the sample contribute <u>a lot</u> to the expectation. **又寸** 与为证表为大保大

#### Chebyshev's Inequality

• For any a > 0,

$$\Pr(|X - E(X)| \ge a) \le \frac{Var[X]}{a^2}$$

#### Second moment method

Theorem. Let x(n) be a random variable with E(x) > 0. If

$$Var(x) = o(\mathbf{E}^2(x))$$
 the first state of  $\mathbf{E}^2(x)$ 

Then x is almost surely greater than zero.x  $\sqrt{1}$ 

**Proof.** If 
$$E(x) > 0$$
, then for  $x \le 0$ ,

$$\Pr(x \le 0) \le \Pr(|x - E(x)| \ge E(x))$$

$$\leq \frac{Var(x)}{E^2(x)} \to 0 \qquad \checkmark$$

$$P(|X-E_X| zE_X)$$

$$= P(XZZE_X) + P(XE_0)$$

### Example: Threshold for graph diameter two (two degrees of separation)

Probability	Transition
$p = o(\frac{1}{n})$	Forest of trees, no component
	of size greater than $O(\log n)$
$p = \frac{d}{n}, d < 1$	All components of size $O(\log n)$
$p = \frac{d}{n}, d = 1$	Components of size $O(n^{\frac{2}{3}})$
$p = \frac{\tilde{d}}{n}, d > 1$	Giant component plus $O(\log n)$ components
$p = \sqrt{\frac{2 \ln n}{n}}$	Diameter two
$p = \frac{1}{2} \frac{\ln n}{n}$	Giant component plus isolated vertices
$p = \frac{\ln n}{n}$	Disappearance of isolated vertices
	Appearance of Hamilton circuit
	Diameter $O(\log n)$
$p = \frac{1}{2}$	Clique of size $(2 - \epsilon) \ln n$

Example: Threshold for graph diameter two (two degrees of separation)

(two degrees of separation)
几月上午的新城(C)最近的足迹)

- Diameter: the maximum length of the shortest path between a pair of nodes.
- Theorem: The property that G(n, p) has diameter two has a sharp threshold at p = 1

$$\sqrt{2}\sqrt{\frac{\ln n}{n}}$$
.

$$\frac{2}{\sqrt{2}} \int_{0}^{\infty} \int_{$$

#### Example: Threshold for graph diameter two (two degrees of separation)

**Theorem.** The property that G(n,p) has diameter

two has a sharp threshold at  $p = \sqrt{2} \sqrt{\frac{\ln n}{n}}$ 

## **Proof.** For any two different vertices i < j,

$$I_{ij} = \begin{cases} 1 & \text{{i,j}} \notin E \text{, no other vertex is adjacent to both } i \text{ and } j \\ 0 & \text{otherwise} \end{cases}$$

$$x = \sum_{i < j} I_{ij}$$

 $x = \sum_{i < i} I_{ij}$  If  $E(x) \xrightarrow{n \to \infty} 0$ , then for large n, almost surely the diameter is at most two.

### Example: Threshold for graph diameter two (two degrees of separation)

**Theorem.** The property that G(n, p) has diameter two has a sharp threshold at  $p = \sqrt{2} \sqrt{\frac{\ln n}{n}}$ 

#### **Proof.** For any two different vertices i < j,

$$I_{ij} = \begin{cases} 1 & \text{{i,j}} \notin E \text{, no other vertex is adjacent to both } i \text{ and } j \\ 0 & \text{otherwise} \end{cases}$$

$$x = \sum_{i < j} I_{ij} \qquad E(x) = \binom{n}{2} (1 - p)(1 - p^2)^{n-2}$$
Take  $p = c\sqrt{\frac{\ln n}{n}}$ ,  $E(x) \cong \frac{n^2}{2} \left(1 - c\sqrt{\frac{\ln n}{n}}\right) \left(1 - c^2 \frac{\ln n}{n}\right)^n$ 

$$\cong \frac{n^2}{2} e^{-c^2 \ln n} = \frac{1}{2} n^{2-c^2}$$

### Example: Threshold for graph diameter two (two degrees of separation)

**Theorem.** The property that G(n,p) has diameter two has a sharp threshold at  $p = \sqrt{2} \sqrt{\frac{\ln n}{n}}$ 

#### **Proof.** For any two different vertices i < j,

$$I_{ij} = \begin{cases} 1 & \text{{i,j}} \notin E \text{, no other vertex is adjacent to both } i \text{ and } j \\ 0 & \text{otherwise} \end{cases}$$

$$x = \sum_{i \le j} I_{ij} \qquad E(x) = \binom{n}{2} (1 - p)(1 - p^2)^{n-2}$$

Take 
$$p = c\sqrt{\frac{\ln n}{n}}$$
,  $c > \sqrt{2}$ ,  $\lim_{n \to \infty} E(x) = 0$ 

For large n, almost surely the diameter is at most two.

• Take 
$$p = c\sqrt{\frac{\ln n}{n}}$$
,  $c > \sqrt{2}$ ,  $\lim_{n \to \infty} \mathbf{E}(x) = 0$ 

• Take 
$$p = c\sqrt{\frac{\ln n}{n}}$$
,  $c < \sqrt{2}$ ,

$$\boldsymbol{E}(x^2) = \boldsymbol{E}\left(\sum_{i < j} I_{ij}\right)^2$$

 $E(x^2) = E\left(\sum_{i \le i} I_{ij}\right)^2$  If  $Var(x) = o(E^2(x))$ , then for large n, almost surely the diameter will be larger than two.

• Take 
$$p = c\sqrt{\frac{\ln n}{n}}$$
,  $c < \sqrt{2}$ 

$$\boldsymbol{E}(x^2) = \boldsymbol{E}\left(\sum_{i < j} I_{ij}\right)^2 = \boldsymbol{E}\left(\sum_{i < j} I_{ij} \sum_{k < l} I_{kl}\right) = \boldsymbol{E}\left(\sum_{i < j} I_{ij} I_{kl}\right) = \sum_{i < j} \boldsymbol{E}\left(I_{ij} I_{kl}\right)$$

$$a = |\{i, j, k, l\}|$$

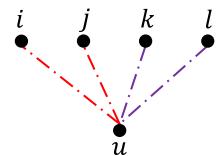

$$E(x^{2}) = \sum_{\substack{i < j \\ k < l \\ a = 4}} E(I_{ij}I_{kl}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ a = 2}} E(I_{ij}^{2})$$

• Take 
$$p = c\sqrt{\frac{\ln n}{n}}$$
,  $c < \sqrt{2}$ 

$$E(x^{2}) = \sum_{\substack{i < j \\ k < l \\ a = 4}} E(I_{ij}I_{kl}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 2}} E(I_{ij}^{2})$$

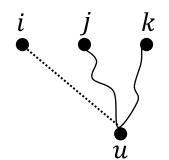

$$\mathbf{E}(I_{ij}I_{kl}) \le (1-p^2)^{2(n-4)} \le \left(1-c^2 \frac{\ln n}{n}\right)^{2n} \left(1+o(1)\right) \le n^{-2c^2} (1+o(1))$$

$$\sum_{i < j} E(I_{ij}I_{kl}) \le \frac{1}{4}n^{4-2c^2}(1+o(1))$$

• Take 
$$p = c\sqrt{\frac{\ln n}{n}}, c < \sqrt{2}$$

$$E(x^2) = \sum_{\substack{i < j \\ k < l \\ a = 4}} E(I_{ij}I_{kl}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 2}} E(I_{ij}I_{ik})$$

• Take 
$$p = c\sqrt{\frac{\ln n}{n}}$$
,  $c < \sqrt{2}$ 

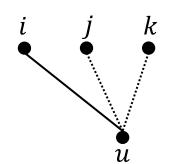

$$E(x^2) = \sum_{\substack{i < j \\ k < l \\ a = 4}} E(I_{ij}I_{kl}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 2}} E(I_{ij}I_{ik})$$

$$= \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\$$

$$E(I_{ij}I_{ik}) \le (1 - 2p^2)^{n-3} = \left(1 - \frac{2c^2 \ln n}{n}\right)^{n-3}$$

$$\stackrel{\cong}{=} e^{-2c^2 \ln n} = n^{-2c^2}$$

$$\stackrel{\longrightarrow}{=} E(I_{ij}I_{ik}) \le n^{3-2c^2}$$

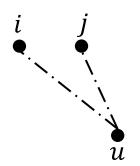

• Take 
$$p = c\sqrt{\frac{\ln n}{n}}$$
,  $c < \sqrt{2}$ 

$$E(x^2) = \sum_{\substack{i < j \\ k < l \\ a = 4}} E(I_{ij}I_{kl}) + \sum_{\substack{i < j \\ i < k \\ a = 3}} E(I_{ij}I_{ik}) + \sum_{\substack{i < j \\ i < k \\ a = 2}} E(I_{ij}I_{ik})$$

$$E(I_{ij}^2) = E(I_{ij})$$

$$\sum_{i,j} \mathbf{E}(I_{ij}^2) = E(x) \cong \frac{1}{2}n^{2-c^2}$$

• Take 
$$p = c\sqrt{\frac{\ln n}{n}}$$
,  $c < \sqrt{2}$ 

$$E(x^2) \le E^2(x)(1 + o(1))$$

A graph almost surely has at least one bad pair of vertices and thus diameter greater than two.
